Taxonomy

Authorities

The taxonomy of this dictionary (family, genus and species status and names) follows the IOC World Bird List (International Ornithological Congress), version **5.4 of October 2015**.

Species vs. subspecies

Bird names are species names in principle. Subspecies considered as full species by some authors but as subspecies by others are also included as species, for example *Motacilla flavissima*. The uncertain status of such taxa is presented in the 'extra info' line, where it is mentioned for example as 'May be subspecies: *Motacilla flava flavissima*'.

Genus

The scientific genus name used as an entry is the one used in IOC World Bird List 2015. Where an alternative name is sometimes used, for example in Clements Checklist 2014, or Sibley and Monroe, 'Distribution and Taxonomy of Birds of the World' 1990 (S & M), or was used in the past, this alternative is given below the preferred Latin name. As an example, for *Thalassarche cauta*, the 'Synonym Latin' box gives '*Diomedea cauta*'. In exceptional cases, two or even three (e.g. *Linaria flavirostris*) alternative genus names are used. All reasonably well-known, including recent, alternative genus names can also be searched for.

Family

The family name is given as the scientific (Latin) name only (ending in *-idae*). The family distribution of the IOC World Bird List is followed. Alternative (previous) family names are given in the 'extra info' box. The families according to the IOC are presented in the multilingual Species Lists.
